some card games

the simplest variation

- two players, Dealer and Player

some card games

the simplest variation

- two players, Dealer and Player
- the deck has just many copies of the high spade cards

some card games

the simplest variation

- two players, Dealer and Player
- the deck has just many copies of the high spade cards
- Dealer makes 5 stacks of cards with no duplicates, all cards face-up

some card games

the simplest variation

- two players, Dealer and Player
- the deck has just many copies of the high spade cards
- Dealer makes 5 stacks of cards with no duplicates, all cards face-up
- Player wins if he can pick a Royal Flush, one card from each stack

some card games

example, a Player win

some card games

example, a Player win

some card games

example, a Dealer win

some card games

winning condition

- Player cannot win if there is a set of k stacks that together have fewer than k different cards

some card games

winning condition

- Player cannot win if there is a set of k stacks that together have fewer than k different cards

some card games

winning condition

- Player cannot win if there is a set of k stacks that together have fewer than k different cards
- Hall's theorem says: **Player wins otherwise**

some card games

making things harder for Dealer

- this isn't a fun game, far too easy for Dealer to win

some card games

making things harder for Dealer

- this isn't a fun game, far too easy for Dealer to win
- to make a better game, we allow Player to modify some of the stacks

some card games

making things harder for Dealer

- this isn't a fun game, far too easy for Dealer to win
- to make a better game, we allow Player to modify some of the stacks

Player's Move

Player can pick any card A from the deck and swap it for another card B in one stack (not containing A).

some card games

making things harder for Dealer

- this isn't a fun game, far too easy for Dealer to win
- to make a better game, we allow Player to modify some of the stacks

Player's Move

Player can pick any card A from the deck and swap it for another card B in one stack (not containing A).

Dealer's Move

Dealer can either do nothing or swap A and B in at most one other stack.

some card games

making things harder for Dealer

- this isn't a fun game, far too easy for Dealer to win
- to make a better game, we allow Player to modify some of the stacks

Player's Move

Player can pick any card A from the deck and swap it for another card B in one stack (not containing A).

Dealer's Move

Dealer can either do nothing or swap A and B in at most one other stack.

Winning

Player wins if he can pick a Royal Flush at the start of one of his turns, otherwise Dealer wins.

some card games

example, a Player win

some card games

example, a Player win

- Player picks a King from the deck and swaps it for a Queen in the first stack

some card games

example, a Player win

- Player picks a King from the deck and swaps it for a Queen in the first stack

some card games

example, a Player win

- Player picks a King from the deck and swaps it for a Queen in the first stack
- Dealer can swap a King and Queen in one of the other stacks

some card games

example, a Player win

- Player picks a King from the deck and swaps it for a Queen in the first stack
- Dealer can swap a King and Queen in one of the other stacks

some card games

example, a Player win

- Player picks a King from the deck and swaps it for a Queen in the first stack
- Dealer can swap a King and Queen in one of the other stacks
- Player wins no matter what Dealer does

some card games

example, a Dealer win

some card games

example, a Dealer win

some card games

example, a Dealer win

some card games

example, a Dealer win

some card games

what was the difference?

some card games

what was the difference?

- in the top game, Dealer can prevent Player from increasing the number of different cards in the first two stacks

some card games

what was the difference?

- in the top game, Dealer can prevent Player from increasing the number of different cards in the first two stacks
- in the bottom game, Dealer cannot prevent Player from increasing the number of different cards in the first three stacks

some card games

necessary condition

- if the same card appears on three stacks, Player can force the addition of a new card to these stacks

some card games

necessary condition

- if the same card appears on three stacks, Player can force the addition of a new card to these stacks
- it is not hard to show that this is essentially all Player can do

some card games

necessary condition

- if the same card appears on three stacks, Player can force the addition of a new card to these stacks
- it is not hard to show that this is essentially all Player can do
- with this we can state a necessary condition

some card games

necessary condition

- if the same card appears on three stacks, Player can force the addition of a new card to these stacks
- it is not hard to show that this is essentially all Player can do
- with this we can state a necessary condition

Degree

The *degree* of a card C in a set of stacks S is the number of times C appears in S . We write $d_S(C)$ for this quantity.

some card games

necessary condition

- if the same card appears on three stacks, Player can force the addition of a new card to these stacks
- it is not hard to show that this is essentially all Player can do
- with this we can state a necessary condition

Degree

The *degree* of a card C in a set of stacks S is the number of times C appears in S . We write $d_S(C)$ for this quantity.

Necessary Condition

If Player has a winning strategy, then for every set of stacks S we must have

$$\sum_{C \in \cup S} \left\lceil \frac{d_S(C)}{2} \right\rceil \geq |S|.$$

some card games

winning condition

- **this necessary condition is also sufficient**

some card games

winning condition

- **this necessary condition is also sufficient**

Winning Condition

Player has a winning strategy if and only if for every set of stacks S we have

$$\sum_{C \in \cup S} \left\lceil \frac{d_S(C)}{2} \right\rceil \geq |S|.$$

some card games

proof idea

- 1 Player looks for a set of card types that give a system of distinct representatives of all the stacks containing them

some card games

proof idea

- 1 Player looks for a set of card types that give a system of distinct representatives of all the stacks containing them

some card games

proof idea

- 1 Player looks for a set of card types that give a system of distinct representatives of all the stacks containing them

some card games

proof idea

- 1 Player looks for a set of card types that give a system of distinct representatives of all the stacks containing them

some card games

proof idea

- 1 Player looks for a set of card types that give a system of distinct representatives of all the stacks containing them
- 2 Player calls those stacks done and never plays with those card types again

some card games

proof idea

- ③ if no such set of card types exists, then Hall's theorem shows that there is at least one card appearing on none of the remaining stacks

some card games

proof idea

- 3 if no such set of card types exists, then Hall's theorem shows that there is at least one card appearing on none of the remaining stacks
- 4 but then some card appears at least thrice, so Player can increase the number of card types in the stacks.

some card games

proof idea

- 3 if no such set of card types exists, then Hall's theorem shows that there is at least one card appearing on none of the remaining stacks
- 4 but then some card appears at least thrice, so Player can increase the number of card types in the stacks.
- 5 goto step 1

some card games

proof idea

- ③ if no such set of card types exists, then Hall's theorem shows that there is at least one card appearing on none of the remaining stacks
- ④ but then some card appears at least thrice, so Player can increase the number of card types in the stacks.
- ⑤ goto step 1

some card games

proof idea

- 3 if no such set of card types exists, then Hall's theorem shows that there is at least one card appearing on none of the remaining stacks
- 4 but then some card appears at least thrice, so Player can increase the number of card types in the stacks.
- 5 goto step 1

some card games

proof idea

- ③ if no such set of card types exists, then Hall's theorem shows that there is at least one card appearing on none of the remaining stacks
- ④ but then some card appears at least thrice, so Player can increase the number of card types in the stacks.
- ⑤ goto step 1

A generalization of Hall's theorem

making it harder for Player

- allow Dealer to make more swaps in response to Player's move

A generalization of Hall's theorem

making it harder for Player

- allow Dealer to make more swaps in response to Player's move
- for each $t \geq 1$, the t -game is where Dealer is allowed to make up to t swaps.

A generalization of Hall's theorem

making it harder for Player

- allow Dealer to make more swaps in response to Player's move
- for each $t \geq 1$, the t -game is where Dealer is allowed to make up to t swaps.

Winning Condition

Player has a winning strategy in the t -game if and only if for every set of stacks S we have

$$\sum_{C \in \cup S} \left\lceil \frac{d_S(C)}{t+1} \right\rceil \geq |S|.$$

A generalization of Hall's theorem

making it harder for Player

- allow Dealer to make more swaps in response to Player's move
- for each $t \geq 1$, the t -game is where Dealer is allowed to make up to t swaps.

Winning Condition

Player has a winning strategy in the t -game if and only if for every set of stacks S we have

$$\sum_{C \in \cup S} \left\lceil \frac{d_S(C)}{t+1} \right\rceil \geq |S|.$$

- Hall's theorem is the winning condition in the $(k-1)$ -game when there are k total stacks

edge coloring

setup

- assign colors to the edges of a graph so that incident edges get different colors

edge coloring

setup

- assign colors to the edges of a graph so that incident edges get different colors
- how few colors can we use?

edge coloring

setup

- assign colors to the edges of a graph so that incident edges get different colors
- how few colors can we use?

Vizing's theorem

Any simple graph can be edge-colored using at most one more color than its maximum degree.

edge coloring

proof of Vizing's theorem

- take a minimum counterexample to Vizing's theorem, say it has maximum degree Δ

edge coloring

proof of Vizing's theorem

- take a minimum counterexample to Vizing's theorem, say it has maximum degree Δ
- remove a vertex of degree Δ and edge-color the rest with $\Delta + 1$ colors

edge coloring

proof of Vizing's theorem

- take a minimum counterexample to Vizing's theorem, say it has maximum degree Δ
- remove a vertex of degree Δ and edge-color the rest with $\Delta + 1$ colors

edge coloring

proof of Vizing's theorem

- take a minimum counterexample to Vizing's theorem, say it has maximum degree Δ
- remove a vertex of degree Δ and edge-color the rest with $\Delta + 1$ colors

edge coloring

proof of Vizing's theorem

- take a minimum counterexample to Vizing's theorem, say it has maximum degree Δ
- remove a vertex of degree Δ and edge-color the rest with $\Delta + 1$ colors

edge coloring

proof of Vizing's theorem

- take a minimum counterexample to Vizing's theorem, say it has maximum degree Δ
- remove a vertex of degree Δ and edge-color the rest with $\Delta + 1$ colors

edge coloring

proof of Vizing's theorem

- take a minimum counterexample to Vizing's theorem, say it has maximum degree Δ
- remove a vertex of degree Δ and edge-color the rest with $\Delta + 1$ colors

edge coloring

proof of Vizing's theorem

- take a minimum counterexample to Vizing's theorem, say it has maximum degree Δ
- remove a vertex of degree Δ and edge-color the rest with $\Delta + 1$ colors

edge coloring

proof of Vizing's theorem

- **exchanging colors on a two-colored path is just a Player move followed by a Dealer move**

edge coloring

proof of Vizing's theorem

- **exchanging colors on a two-colored path is just a Player move followed by a Dealer move**
- we can make any of Player's legal moves this way, so if the winning conditions are satisfied, Vizing's theorem is true

edge coloring

proof of Vizing's theorem

- **exchanging colors on a two-colored path is just a Player move followed by a Dealer move**
- we can make any of Player's legal moves this way, so if the winning conditions are satisfied, Vizing's theorem is true
- each stack has at least two colors, so counting the 'cards' in two ways we get for each set of stacks S ,

$$\sum_{C \in S} d_S(C) \geq 2|S|$$

edge coloring

proof of Vizing's theorem

- **exchanging colors on a two-colored path is just a Player move followed by a Dealer move**
- we can make any of Player's legal moves this way, so if the winning conditions are satisfied, Vizing's theorem is true
- each stack has at least two colors, so counting the 'cards' in two ways we get for each set of stacks S ,

$$\sum_{C \in S} d_S(C) \geq 2|S|$$

- so, we have the desired winning condition

$$\sum_{C \in S} \frac{d_S(C)}{2} \geq |S|$$

summary

- we introduced a simple card game

summary

- we introduced a simple card game
- Player can pick any card A from the deck and swap it for another card B in one stack (not containing A).

summary

- we introduced a simple card game
- Player can pick any card A from the deck and swap it for another card B in one stack (not containing A).
- Dealer can either do nothing or swap A and B in at most one other stack.
